Can you not envision a situation where morse code would be the only way to communicate? The latest incident that I am aware of occurred on Oct 4, 1980. 535 people were saved in the Gulf of Alaska. while it was not an amateur station, it was morse code. Today, with nuclear threats growing, do you not see a need to have, in reserve, some people trained in morse code? Shouldn't we be prepared for any situation? Or should we just assume that our satellites, and computer technology will always come through? What is the harm in keeping at least a small segment of the amateur radio service in reserve for worst cases.
